Memory V1 and V2

What changes for the user

Private Memory V2 gives a Crew Member its own working memory for chat, Crew assignments and scheduled Agent work. New members start with unique empty V2 memory when the setup supports it. Existing members keep their current Global or named V1 memory until the owner chooses and confirms private memory. This also applies to the member selected as the default agent.

Memory that belongs to a member

User need	Memory V1	Private Memory V2
Keep work in context	Global and named stores continue to support existing work and V1 members.	 Each member owns separate memory, identified by its native Crew avatar.
Bring guidance forward	Existing session-start guidance and automatic learning continue.	Essential guidance returns every turn. Relevant facts and lessons are recalled when requested.
Return to older work	Existing age and record-capacity rules continue.	No age decay or automatic removal for age, capacity or revision count. Fact validity and explicit forgetting still apply.
Correct what was learned	Existing conflict rules continue. History keeps the latest 20 accepted revisions of each record; proposals remain.	Uncertain automatic corrections become proposals. The owner previews edits and forgetting.
Reuse useful knowledge	Knowledge remains in its current store.	Copy memories brings selected records into a member store and keeps their source information.

The owner chooses starting knowledge and controls later corrections. V2 does not automatically move V1 data or combine several members into one private memory.

V1 keeps current records while trimming older accepted revision history. Export older history you need before upgrading. V2 does not automatically trim that history. Neither policy guarantees a maximum total storage size.

02 / MEMORY V2

From setup to everyday use

- 1 Choose when to start.** Existing V1 members can keep working. To opt in, open Crew Manager, choose the member, then Workspace, Memory and Create private memory. Finish or stop the member's work and child tasks first. The confirmation explains that memory starts empty, the next chat is fresh and the member cannot switch back to V1. Old data and conversations remain.
- 2 Choose starting knowledge.** Start empty or use Copy memories for up to 50 selected records from Global, a named store or another member. Source records and existing destination records stay in place.
- 3 Work with one member or a Crew.** With Crew Mode off, chat directly with a member. With Crew Mode on, the coordinator assigns work and combines findings. Existing conversations and schedules keep their recorded memory identity; opting in does not convert them.
- 4 Review and correct.** In Memories, inspect Facts, Lessons and Experiences and their sources. Edit selected records, then review every preview page and pending proposal before Apply. Profile holds essential guidance. Forgetting removes a record from recall; it has no direct Undo.
- 5 Keep a recovery path.** Active V2 members have automatic backups. V1 backups are manual. Whole-memory restore takes effect after restart. Deleting a member keeps its old data; recreating the name starts fresh. Archived memory has no direct reattachment option.

Start with a supported pilot

Confirm that the setup supports private memory before adding members. Unavailable memory pauses the affected work and explains the reason. The gateway owner can run kirocrew doctor to identify member setup problems. Creation shows its current progress. Recovery may require a restart.

During a setup or storage incident, the owner can pause new private memories and V1 opt-ins. Existing work still follows its normal checks, and work already admitted is not cancelled. Assign an owner for backups, disk usage and recovery before expanding the pilot.

Historical 44546 retrieval found relevant records for 49 of 50 authored topics with full vectors. The same examples informed calibration. Its nine memory-interface scenarios also passed first attempt. These results do not prove better answers, teamwork, a gain over V1 or lower cost. Current CI, security and reviews remain open.
